ME 360L - Mechanical Engineering Design III " Spring 2012

CIGR is an international, non-governmental, non-profit organization providing a networking system for regional and national societies of agricultural engineering as well as private and public companies and individuals all over the world.

CIGR Journal

Ductility is a measure of a material's ability to undergo significant plastic deformation before rupture, which may be expressed as percent elongation or percent area reduction from a tensile test.

Ductility - Wikipedia

The Goodman relation can be represented mathematically as: $\sigma = \tilde{\sigma} - (\hat{\sigma})$. Where σ is the alternating stress, $\tilde{\sigma}$ is the mean stress, $\hat{\sigma}$ is the fatigue limit for completely reversed loading, and σ_u is the ultimate tensile strength of the material.

Goodman relation - Wikipedia

The relationship varies from 0.5 to 0.577, whether you use Tresca or von Mises criterion. Also, a value of 0.6 (which is an approximation of 0.577) is recommended in Shigley's textbook.

Is there any relationship between shear strength and
